

Project

- 1.Text to speech convertor
- 2.QR code generator

Project Description

My first project is a Text-to-Speech Converter.

In this project, the user enters any text.

The text is sent to a Text-to-Speech API, which converts the text into voice output.

The generated audio is then played for the user.

My second project is a QR Code Generator.

In this project, the user enters a name, phone number, or URL.

The system generates a QR code for the given input using a JavaScript library.

The QR code is created on the client side without using any API calls.

This makes the application fast and efficient.

Currently I have developed my project using HTML, CSS, and JavaScript.
